

Neural Stock Intelligence

N E U L A B I N C .

Complete User Manual — June 2026

stock.neulab.xyz

Important

This document is an educational research tool guide. Nothing in this manual or in the Neural Stock Intelligence platform constitutes financial advice. All investment decisions are your own responsibility.

1.1 What This App Does

Neural Stock Intelligence is an AI-powered research assistant. It reads price history, technical indicators, candlestick patterns, fundamentals, and (for IDX stocks) institutional filing data — then produces a structured research summary with a directional bias (BUY / HOLD / SELL) and a confidence score.

Think of it as a junior analyst that works 24/7 — but one whose output you must read critically, not blindly follow. The AI gives you a structured starting point. You still make the decision.

1.2 How the AI Works

When you trigger an analysis, five parallel data pipelines run simultaneously:

Technical pipeline

Fetches up to 6 months of daily OHLCV price data. Computes RSI, MACD, Bollinger Bands, EMA crossovers, volume trends, and ATR. Identifies support/resistance levels and trend direction.

Fundamental pipeline

Pulls P/E, P/B, EPS, revenue growth, debt/equity, and analyst consensus. For IDX stocks, also fetches quarterly filing data. Data may be one quarter stale for IDX.

Candlestick pipeline

Scans for 15 classic candlestick patterns (Hammer, Engulfing, Doji, Shooting Star, etc.) across daily and weekly timeframes. Counts pattern quality and directional bias.

Bandarmology (IDX only)

Cross-references institutional investor net-buy/sell filing data from IDX disclosures. Detects persistent accumulation or distribution signals. Lags actual transactions by 5-30 days.

LLM synthesis

All outputs are assembled into a structured prompt and sent to an AI reasoning model. It weighs evidence across all pillars, resolves contradictions, and produces the verdict.

Watch out

The LLM synthesises inputs but does not have real-time market access. Prices are fetched at analysis time and may be minutes behind live trading. It classifies evidence patterns — it does not predict the future.

1.3 Reading Verdicts Correctly

The verdict badge (BUY / HOLD / SELL) is an analytical bias classification, not a trade instruction.

BUY

The weight of evidence is predominantly bullish. More upside factors than downside detected at this moment. Not a guarantee of price appreciation.

HOLD

Signals are mixed, insufficient, or contradictory. The model cannot form a strong directional conviction. This is valid output — do not force a read that is not there.

SELL

The weight of evidence is predominantly bearish. More downside factors than upside detected at analysis time. Not a guaranteed decline.

1.4 The Confidence Score

The confidence score (0-100) measures the model's classification strength — how aligned the input signals are. It does NOT measure the probability that the price will move in the predicted direction.

- 0-45: Weak — signals contradict each other. Low conviction. Treat with scepticism.
- 46-74: Moderate — partial alignment. Some signals confirm, others diverge.
- 75-100: High — strong signal alignment across multiple pillars. This triggers Alerts.

Watch out

A 90% confidence BUY does not mean 90% chance of going up. It means the model found very aligned bullish evidence. The stock can still fall.

1.5 Three Analysis Modes

Standard — Fundamentals + Technicals

Use for blue-chip long holds, IDX stocks with low liquidity, or when you want a purely quantitative read. Most grounded. Least influenced by short-term price noise. Misses timing signals.

Candlestick — Price patterns only

Use for swing trading setups, confirming entry timing, or when fundamentals are stale. Fast and timing-sensitive. Ignores fundamentals entirely — a bullish pattern on a company with deteriorating earnings is still dangerous.

Hybrid — All three pillars (default)

Default choice for most situations. Highest information density. Candlestick patterns confirm or contradict the technical/fundamental read. Takes longer. Recommended for all standard research.

2.1 Sign Up & Onboarding

Go to stock.neulab.xyz and sign up with your email and a password (minimum 6 characters). No credit card required. Free tier activates immediately.

- Step 1: Create account — enter name, email, password. Tap Create account.
- Step 2: Accept disclaimer — tick the research disclaimer on first login. One-time only.
- Step 3: Onboarding wizard — choose your markets (US/IDX/both), experience level, and starter watchlist tickers.

Tip

All wizard answers are changeable later in Settings. Do not overthink the initial setup.

2.2 Dashboard Tour

Quota strip

Top of dashboard. Shows analyses used today, weekly cap, watchlist count. Resets at midnight UTC. Turn amber when 2 analyses remain, red when at the limit.

Alerts module

High-confidence verdicts ($\geq 75\%$) since your last visit. These are the signals worth reviewing first each session.

Highest-conviction setups (IDX)

Top IDX confluence setups from the last 7 days, ranked by quality score. First stop for IDX traders each morning.

Watchlist

Your tracked tickers. Each row shows live price, change %, and the last verdict badge + confidence. Tap the sparkle icon to re-analyse.

2.3 Run Your First Analysis

- Step 1: Click Add Stock on the dashboard. Type a ticker — AAPL, BBKA.JK, NVDA.
- Step 2: Select Hybrid mode (default — recommended for beginners).
- Step 3: Tap the sparkle icon on the ticker row.
- Step 4: Wait 15-45 seconds. Live phase labels show progress: Fetching data > Technical scan > LLM synthesis > Done.
- Step 5: Tap the arrow on the row to open the full report page.

Normal behaviour

If you see 'Waking up server...' on your first analysis of the day, wait 10-15 seconds. The backend sleeps during inactivity to save costs. The app auto-retries once.

2.4 Anatomy of a Verdict Page

- 1 - Verdict ring: BUY / HOLD / SELL badge with confidence score. Ring fill represents confidence level.
- 2 - Executive summary: The most important section. Read this fully — not just the badge.
- 3 - Confidence breakdown: Which pillar (technical/fundamental/candlestick) drove the verdict.
- 4 - Bull/Bear/Neutral scenarios: What would make the verdict right or wrong. Always read the Bear scenario.
- 5 - Technical panel: RSI, MACD, Bollinger, volume, trend, support/resistance.
- 6 - Fundamental panel: P/E, earnings, revenue growth, analyst consensus. Note data freshness date.
- 7 - Candlestick panel (Hybrid/Candle modes): Patterns detected and their directional bias.
- 8 - Random Forest opinion: ML model's probability estimate. Use as a second opinion, not primary signal.
- 9 - Intrinsic value anchor: Rough DCF estimate. Shows current price vs estimated fair value.
- 10 - Bandarmology (IDX only): Institutional flow data. Persistent accumulation = smart money building a position.
- 11 - Action bar: Share | Trade Slip PDF | Export full PDF | Re-analyse.

3.1 Watchlist & Batch Sweeps

Your watchlist is a research shortlist, not a portfolio tracker. Keep it focused on stocks you are actively researching.

Important

Adding a stock to your watchlist does not trigger automatic analysis. Prices are live but verdict badges are from your last manual analysis. Always re-analyse before acting.

- Keep it focused — 5-10 actively followed stocks is more useful than 25 stale ones
- Re-analyse on the day you plan to act — verdicts from last week may be stale
- Use Top 3 / Bottom 3 sweep (Pro+) at the start of each day to refresh key movers without spending all daily quota

3.2 Pattern Scan

Pattern Scan runs a fast candlestick screen across all tickers simultaneously. It does not run a full AI analysis — it detects formations and flags tickers worth closer attention.

- Run Pattern Scan first thing each morning to spot overnight formations
- Filter to Excellent / Strong quality tiers — ignore Weak hits for trading decisions
- When a ticker flags with a strong pattern, THEN run full Hybrid analysis on it
- Pattern Scan is a triage tool — not a trade trigger on its own

3.3 Alerts & Telegram

An alert fires when any watchlist analysis produces a verdict with confidence $\geq 75\%$. These are the system's highest-conviction signals.

- Connect Telegram once in Settings — receive push alerts for every high-confidence verdict
- Set quiet hours so you are not disturbed outside trading hours
- Alert prices are the price at analysis time — may have moved by the time you see the notification

Watch out

A high-confidence alert is still not a trade instruction. Review the full report before acting. Alerts only fire for tickers in your watchlist.

3.4 Master Do's, Don'ts & Watch-outs

Using verdicts correctly

DO

- Read the full executive summary, not just the badge
- Check the Bear scenario — it tells you when you would be wrong
- Re-analyse on the day you plan to act
- Use verdicts to confirm or challenge your own thesis

- Track your own accuracy via the Score Card

DO NOT

- Buy or sell based solely on the BUY / SELL badge
- Assume high confidence equals a guaranteed outcome
- Compare verdicts from different analysis dates without re-running
- Ignore a SELL verdict on a stock you are emotionally attached to
- Use a single analysis to justify a large position

Managing your daily quota

DO

- Use batch sweep (Pro+) at the start of day to refresh top/bottom movers
- Use Pattern Scan to triage before deciding which tickers to run full analysis on
- Prioritise analyses where a decision is imminent

DO NOT

- Re-analyse the same stock multiple times hoping for a different verdict
- Run analyses late at night on IDX stocks when the market is closed — data will be stale

IDX-specific watch-outs

- Bandarmology data lags 5-30 days behind actual transactions. It is confirmatory background context, not a timing signal.
- IDX fundamental data may be one quarter stale. Always check the data-as-of date in the fundamental panel.
- Low-liquidity IDX stocks produce noisy candlestick signals — the model may flag artefacts of thin volume.
- The IDX market opens 09:00-16:00 WIB. Analyses run outside these hours use the last closing price.
- Recent IDX IPOs may have limited history. The model needs at least 15 trading days to produce a reliable technical read.

US stock watch-outs

- US pre-market and after-hours moves are not captured in analyses run during those windows.
- Earnings announcements can invalidate a verdict within hours. Always re-analyse after earnings are released.
- Highly speculative or meme stocks produce low-confidence reads because the model cannot find signal in the noise.

Things that look like bugs but are not

- 'Waking up server...' on first analysis — backend sleeps after inactivity. Normal. Takes 10-15 seconds.
- First analysis fails, second works — same cold-start reason, or transient data issue. The app auto-retries.
- HOLD at 42% confidence — valid output. The model found no clear edge. Do not force a read that is not there.

- Verdict did not change after re-analysis — if underlying data has not changed, consistency is correct behaviour.

4.1 Portfolio P&L

Track real positions against live prices and see how Neural's verdicts align with your actual holdings. Not connected to any brokerage — all entries are manual.

- Add each lot separately if you DCA — the portfolio blends them into a weighted average cost
- Use Portfolio P&L to spot when Neural's verdict diverges from a position you are holding
- A SELL verdict on an open position is a prompt to re-examine — not necessarily to sell, but to re-examine

Watch out

Do not use Portfolio P&L as a replacement for your brokerage platform. Track your cost basis accurately — the P&L is only useful if the entry price is correct.

4.2 Score Card

Measures how accurate your past verdicts were. A BUY is a 'Hit' if the stock gained $\geq 5\%$ within the time horizon. A SELL is a 'Hit' if it fell $\geq 5\%$. HOLDS must stay within $\pm 5\%$.

This is your most honest feedback loop. If your hit rate is below 50% on BUY signals, something is wrong with either your stock selection or the market conditions during that period.

Watch out

Score Card results are beta — they measure current price vs entry price, not exact horizon-end price. Verdicts under 7 days old are marked Pending and excluded from accuracy calculations.

4.3 Backtesting Lab

Runs Neural's analysis stack against historical data to show how the model's signals have performed in the past. A transparency and calibration tool — not a guarantee of future performance.

- Pick a ticker and window (3 months / 6 months / 1 year)
- Read the cumulative P&L chart vs SPY or IDX benchmark
- Check the IDX Signal Quality panel for pattern quality distribution

Watch out

Backtesting is inherently backward-looking. Past performance is not indicative of future results. The backtest assumes perfect execution at signal price — real slippage and bid-ask spread reduce actual returns.

4.4 IDX Exclusives — Bandarmology & Top Picks

Bandarmology

Cross-references institutional investor net-buy/sell data from IDX regulatory filings. Detects persistent accumulation (institutions consistently buying) or distribution (consistently selling). Highest quality when `persistence_label = 'persistent_accumulation'` AND `persistence_consistent = true`.

Top IDX Confluences

Dashboard section showing the highest-conviction IDX setups from the last 7 days, ranked by a composite quality score. Use this as your IDX morning scan alongside Pattern Scan.

Watch out

Bandarmology data lags 5-30 days. When you see an accumulation signal, the institutional activity happened in the past, not today. Use it as background context, not a timing trigger. If `volume_gate_tripped=true`, discount the signal.

5.1 Plans Comparison

Guest users get 1 free analysis per IP per 24 hours with a preview verdict. Signing up unlocks the full quota, watchlist, and all features.

Feature	Guest	Free	Week Pass	Pro	Elite
Account required	No	Yes	Yes	Yes	Yes
Analyses / day	1 *	3	10	15	50
Verdict detail	Preview	Full	Full	Full	Full
Watchlist slots	None	5	10	25	500
All 3 analysis modes	No	Yes	Yes	Yes	Yes
Telegram alerts	No	Yes	Yes	Yes	Yes
Pattern Scan	No	No	No	Yes	Yes
Top 3 / Bottom 3 sweep	No	No	No	Yes	Yes
RF Auto-Scan	No	No	No	Yes	Yes
PDF export	No	Yes	Yes	Yes	Yes
Share verdict (public URL)	No	Yes	Yes	Yes	Yes
Backtesting Lab	No	No	Yes	Yes	Yes
Portfolio P&L	No	Yes	Yes	Yes	Yes
Score Card	No	Yes	Yes	Yes	Yes

* Guest: 1 per IP per 24h. Preview only — verdict and confidence score. Sign up for the full report.

Week Pass

Buy a one-time \$4.99 Week Pass for 7 days of Pro-tier access — 10 analyses per day, 10-stock watchlist, PDF export, Backtesting, and share verdicts. No subscription commitment.

5.2 Settings Reference

- Profile — update display name, email, and password
- Markets — set US / IDX / both. Affects dashboard feed prioritisation.
- Experience level — Beginner / Intermediate / Advanced. Affects default mode and tooltip verbosity.
- Analysis mode default — pre-selects mode when you open the watchlist. Default is Hybrid.
- Telegram alerts — link account, set quiet hours, choose alert types.
- Subscription — view current plan, billing cycle, next renewal. Cancel or upgrade here.
- Data & privacy — permanently delete account and all data. Cannot be undone.

5.3 FAQ

Why did my analysis fail on first attempt but work on second?

The backend server sleeps after inactivity (Railway cold-start). The first request wakes it up which takes 10-15 seconds. The app auto-retries once. If it persists, wait a minute and try again.

Why does HOLD at 42% look different from HOLD at 68%?

42% means weak contradictory signals — the model found no meaningful edge. 68% means balanced situation with roughly equal bullish and bearish factors. Both are HOLD but for different reasons. Read the executive summary.

The verdict has not changed after re-analysis — is that a bug?

No. If the underlying data has not changed significantly, the verdict should be stable. Consistency is correct behaviour.

I got a BUY and the stock went down — is the AI broken?

No. A BUY means the evidence at analysis time leaned bullish. Markets can move for reasons the model cannot see — macro events, news breaks, insider activity. The AI classifies patterns, it does not predict the future.

Why is my Score Card hit rate low?

Either the model is misreading your stock selection, or you are selecting stocks in conditions where signals are unreliable (earnings-driven moves, macro-driven markets). Try filtering to only high-confidence verdicts ($\geq 75\%$) and see if that cohort performs better.

I cancelled my subscription — why am I on Free immediately?

Cancellation takes effect at the end of the current billing period, not immediately. You keep access until the period ends. Your cancellation date is shown in Settings > Subscription.

5.4 Important Disclaimer

Not Financial Advice

Neural Stock Intelligence is an educational research tool. It is not a licensed financial advisor, broker, or investment service. Nothing produced by this platform — including all AI-generated verdicts, confidence scores, scenarios, or recommendations — constitutes financial advice or a recommendation to buy, sell, or hold any security. All investment decisions are your own. You are solely responsible for their outcomes. Past accuracy of verdicts does not guarantee future accuracy. Markets are inherently unpredictable and all investments carry risk, including the risk of total loss. Always conduct your own research and consult a qualified financial professional before making significant investment decisions.
